

Project Design Phase

Solution Architecture

Date	29 September 2026
Team ID	6ab75b2068850e4f5dce0e19
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

The solution architecture connects the school IT helpdesk problem with a ServiceNow-based automation. A ticket is created by the caller, stored in Ticket Records, processed by Flow Designer using predefined classification rules, and followed by an email confirmation to the caller.

Architecture and Data Flow

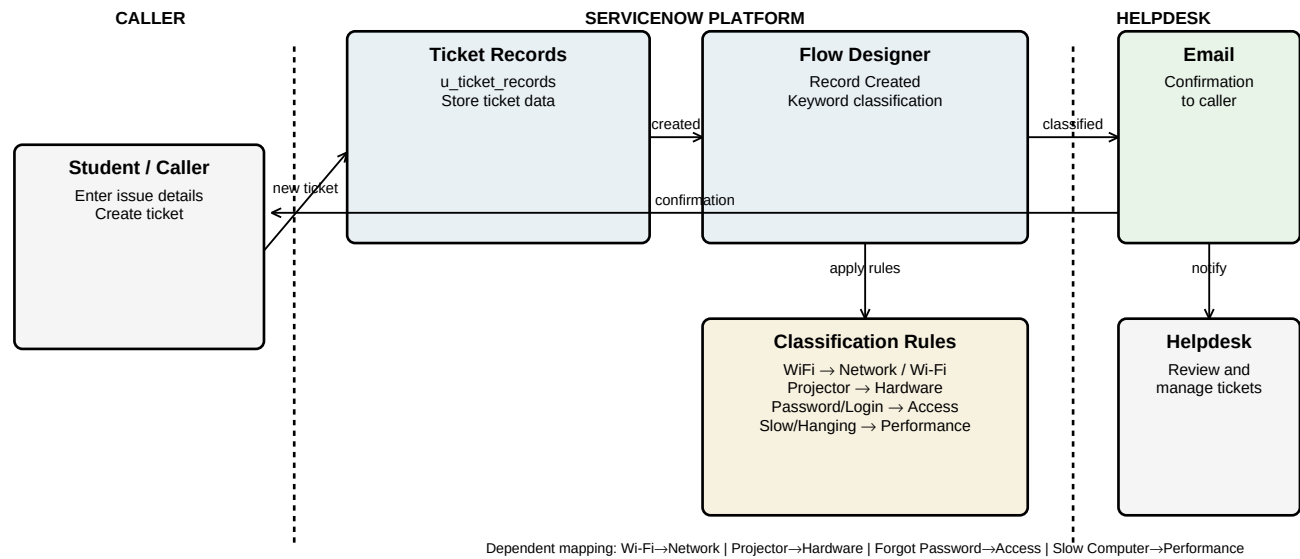

Figure 1: Architecture and data flow of the Auto Ticket Classification using Flow Designer solution

Architecture Components

Component	Role in Solution
Student / Caller	Creates the IT support ticket and provides the issue description.
Ticket Records	Stores caller, issue, category, subcategory, state and other ticket information.
Flow Designer	Runs when a record is created and applies predefined keyword-based classification.
Classification Rules	Maps issue keywords to Category and Subcategory, including dependent choices.
Email Notification	Sends a ticket confirmation to the caller after creation.
IT Helpdesk / Admin	Reviews and manages the resulting ticket records and maintains the workflow.
