Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit Template:

Problem-Solution Fit checks whether the identified customer problem is addressed by the proposed solution, and whether the solution fits the customer's situation and behaviour.

Purpose:

- Solve the customer problem in a way that fits the target group's situation.
- Improve adoption by fitting the existing ticket-handling workflow.
- Improve communication through clear ticket confirmation.
- Reduce frequent manual classification effort and improve routing.
- Understand the current manual process and improve it for the helpdesk.

Template:

1. CUSTOMER SEGMENT(S) School IT helpdesk staff, students and teachers who raise IT support tickets.	6. CUSTOMER CONSTRAINTS Manual review takes time. Correct Category/Subcategory selection is required. The solution must fit the existing ServiceNow workflow and remain maintainable.	5. AVAILABLE SOLUTIONS Existing approach: helpdesk staff manually read the description, choose Category/Subcategory, process the ticket and inform the caller. Familiar, but time-consuming and harder to scale.
2. JOBS-TO-BE-DONE / PROBLEMS Classify incoming IT support tickets; assign the correct Category and Subcategory; store standardized ticket information; notify the caller after ticket creation.	9. PROBLEM ROOT CAUSE The current process depends on manual review of ticket descriptions and manual classification. There is no automatic rule-based classification at ticket creation.	7. BEHAVIOUR Staff review the issue description, identify the issue type, select Category/Subcategory, process the ticket and communicate with the caller.
3. TRIGGERS A new IT support ticket is created with an issue description that needs classification.	10. YOUR SOLUTION Use ServiceNow Flow Designer when a Ticket Record is created. Apply predefined keyword rules, assign Category/Subcategory using the project mappings, store the ticket and send an email notification to the caller.	8. CHANNELS OF BEHAVIOUR 8.1 ONLINE ServiceNow ticket form and email notification. 8.2 OFFLINE Helpdesk staff review and manage ticket records as part of the support workflow.
4. EMOTIONS: BEFORE / AFTER Before: manual classification is time-consuming and can feel inefficient. After: classification is consistent, routing is more efficient and the caller receives confirmation.
