

Project Design Phase

Proposed Solution

Date	29 September 2026
Team ID	6ab75b2068850e4f5dce0e19
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	School IT helpdesk staff manually review incoming support tickets, identify the issue type, select the correct Category and Subcategory, process the ticket and inform the caller. This is time-consuming and can make classification and routing less efficient.
2.	Idea / Solution description	Implement automatic IT ticket classification using ServiceNow Flow Designer. When a Ticket Record is created, predefined keyword rules classify the issue and assign Category/Subcategory. The ticket is stored in a standardized format and an email notification is sent to the caller.
3.	Novelty / Uniqueness	A no-code, rule-based workflow connects ticket creation, keyword-based classification, dependent Category/Subcategory logic, structured Ticket Records and caller notification in one ServiceNow workflow.
4.	Social Impact / Customer Satisfaction	Reduces repetitive manual classification for the school IT helpdesk and provides consistent ticket processing. Callers receive an automated confirmation after ticket creation, improving clarity about their request.
5.	Business Model (Revenue Model)	This project is an internal school IT helpdesk automation and is not specified as a revenue-generating product. Its business value is operational: reducing manual effort and improving routing efficiency.
6.	Scalability of the Solution	The Flow Designer workflow and standardized Ticket Records can be maintained and extended with additional classification rules, categories and subcategories as future support requirements grow.
