

PROJECT DOCUMENTATION

ServiceNow Flow Designer Implementation Documentation

Project Name	Auto Ticket Classification using Flow Designer
Team ID	6ab75b2068850e4f5dce0e19
Team Leader	Mohan Srinivasan K.N
Documentation Date	02 October 2026

Dedicated documentation for the implemented ServiceNow project

1. Introduction

Project Title

Auto Ticket Classification using Flow Designer

Team Members and Roles

Name	Role
Mohan Srinivasan K.N	Team Leader
Krishnakumar T.	Team Member
Dinesh S.	Team Member
Wilson Thomas A.	Team Member

2. Project Overview

The project automates classification of school IT helpdesk tickets. It identifies issue types from ticket descriptions, assigns Category and Subcategory, stores structured records, and sends a confirmation notification to the caller.

Key Features

- Ticket creation and structured storage.
- Automatic keyword-based classification.
- Category/Subcategory assignment.
- Dependent Category/Subcategory choice logic.
- Caller email notification.
- Maintainable Flow Designer rules.

3. Architecture

Layer	Project Implementation
User Interface	ServiceNow Ticket Records form
Automation	ServiceNow Flow Designer
Classification	Predefined keyword conditions
Data	Ticket Records [u_ticket_records]
Notification	ServiceNow email notification

Architecture Flow

Student/Caller → Ticket Records → Flow Designer → Classification Rules → Category/Subcategory → Email Notification / IT Helpdesk.

4. Setup / Environment

- ServiceNow Developer instance.
- Ticket Records [u_ticket_records] table configured for the project.
- Flow Designer used to implement the automation.

- No separate Node.js, React, MongoDB, or MERN installation is required for this project.

5. Data / Record Structure

Field	Type / Purpose
Number	Auto Number
Caller	Reference to sys_user
Category	Choice: Network, Hardware, Access, Performance
Subcategory	Choice: Wi-Fi, Projector, Forgot Password, Slow Computer
Short Description	String
Description	String
State	New, In progress, On hold, Resolved, Closed
Assigned Group	Reference to sys_user_group
Assigned to	Reference to sys_user

6. Classification Rules

Keyword / Issue	Category	Subcategory
WiFi	Network	Wi-Fi
Projector	Hardware	Projector
Password or Login	Access	Forgot Password
Slow or Hanging	Performance	Slow Computer

7. Running / Workflow Behavior

The flow starts when a Ticket Records record is created and the Category field is blank. The flow evaluates the ticket description, applies the matching predefined rule, updates the classification fields, and performs the configured notification action.

8. Testing

Test Case	Scenario	Result
TC-001	Network / Wi-Fi classification — TIC0001001	PASS
TC-002	Email notification generation	PASS
TC-003	Hardware / Projector classification — TIC0001006	PASS

9. Demo Video

The project demo video will be submitted through the dedicated demo-video link provided in the SkillWallet application. No screenshot or demo-link placeholder is included in this document.

10. Future Enhancements

- Expand classification keywords and issue scenarios.
- Add further routing and notification rules.
- Add broader regression tests for future workflow changes.
- Consider advanced classification only if future requirements justify it.

11. Deployment

The ServiceNow Project Update Set was completed with 43 customer updates and exported to an XML file for deployment/transfer of the configured project changes.

This deployment record reflects the completed update-set export used for the project; it is not a claim that the project was deployed to a separate production environment.

12. Project Identification

Project	Auto Ticket Classification using Flow Designer
Team ID	6ab75b2068850e4f5dce0e19
Team Leader	Mohan Srinivasan K.N
Testing Date	30 September 2026
