Report Structure

This report follows the supplied Project Report Format and adapts sections that are specific to the actual ServiceNow project. MERN-specific implementation details, unrelated customer journey content, and unsupported performance-testing claims are not invented.

TABLE OF CONTENTS

Section	Title
1	Introduction
2	Ideation Phase
3	Requirement Analysis
4	Project Design
5	Project Planning & Scheduling
6	Functional and Performance Testing
7	Results
8	Advantages & Disadvantages
9	Conclusion
10	Future Scope
11	Appendix

1. INTRODUCTION

1.1 Project Overview

Auto Ticket Classification using Flow Designer is a ServiceNow-based no-code automation project for a school IT helpdesk. The solution uses ServiceNow Flow Designer to classify newly created IT support tickets from their issue descriptions, assign Category and Subcategory values, store the information in a standardized Ticket Records table, and generate a caller notification.

1.2 Purpose

The purpose is to reduce repetitive manual classification, improve consistency in ticket routing, and provide a maintainable workflow that can be extended with additional classification rules.

Project Scope

- Ticket creation and structured storage in Ticket Records [u_ticket_records].
- Automatic classification using predefined issue-description keywords.
- Category/Subcategory assignment with dependent choice logic.
- Automated email notification to the caller.
- Testing of representative Wi-Fi, Projector, and email-notification scenarios.

2. IDEATION PHASE

2.1 Problem Statement

School IT helpdesk staff must manually review incoming support-ticket descriptions and identify the correct category and subcategory. This makes classification repetitive and can reduce processing efficiency.

2.2 Empathy Map Canvas

Area	Project Findings
User	School IT Helpdesk Staff
Think / Feel	Correct classification and consistent processing are important; repetitive manual classification takes time.
See	Incoming support tickets, descriptions, category and subcategory fields.
Say / Do	Review issue descriptions, identify issue type, select category/subcategory, process the ticket.
Pains	Repetitive manual classification and risk of incorrect classification.
Gains	Automatic classification, standardized records, caller notification, maintainability.

2.3 Brainstorming

The ideation considered automatic ticket classification, category assignment, subcategory assignment, dependent choices, standardized ticket information, caller notification, Flow Designer automation, and future scalability. The selected solution was automated IT ticket classification using ServiceNow Flow Designer.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

Not included as a separate artifact because the project is a backend/service-workflow automation rather than a customer-facing journey design. The project instead uses user stories and a data-flow representation to define system behavior.

3.2 Solution Requirements

ID	Requirement
FR-1	Ticket Creation & Storage
FR-2	Automatic Ticket Classification
FR-3	Category & Subcategory Assignment
FR-4	Dependent Category/Subcategory
FR-5	Caller Notification
FR-6	Maintainable & Scalable Flow
NFR-1	Usability
NFR-2	Reliability
NFR-3	Performance/Efficiency
NFR-4	Scalability
NFR-5	Maintainability

3.3 Data Flow Diagram

Student/Caller → Create IT Support Ticket → Flow Designer Classification → Classification Rules → Ticket Records / Email Notification → IT Helpdesk Staff.

Classification mapping:

- WiFi → Network / Wi-Fi
- Projector → Hardware / Projector
- Password or Login → Access / Forgot Password
- Slow or Hanging → Performance / Slow Computer

3.4 Technology Stack

Component	Implementation
User Interface	ServiceNow Ticket Records form
Application Logic	ServiceNow Flow Designer
Rules	Flow Designer conditions and predefined keywords
Database	ServiceNow Ticket Records [u_ticket_records]
Notification	ServiceNow email notification
Infrastructure	ServiceNow Developer instance
ML Model	Not applicable; rule-based keyword classification

Component	Implementation
External APIs	Not used

4. PROJECT DESIGN

4.1 Problem–Solution Fit

Parameter	Project Fit
Customer Segment	School IT helpdesk staff and ticket callers
Jobs / Problems	Classify incoming tickets consistently and process them efficiently
Triggers	Creation of a new IT support ticket
Available Solution	Manual review and classification before automation
Constraints	Use the ServiceNow environment and maintain a no-code workflow
Root Cause	Issue type must be identified from ticket descriptions manually
Proposed Solution	Flow Designer automatically applies predefined classification rules

4.2 Proposed Solution

When a Ticket Records record is created, the Flow Designer flow evaluates the issue description using predefined keyword rules. The flow assigns the appropriate Category and Subcategory, keeps the ticket in a standardized structure, and sends a confirmation email to the caller.

4.3 Solution Architecture

Caller → Ticket Records → Flow Designer → Classification Rules → Category/Subcategory assignment → Email notification / IT Helpdesk processing.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The dedicated Project Planning Phase used the supplied Product Backlog, Sprint Planning, Stories and Story Points template. Story points follow the supplied 1, 2, 3, 5 scale, and sprint velocity is based on completed story points divided by the number of sprints.

User Story	Story / Task	Points	Priority
US-1	Create and store Ticket Records with required fields	3	High
US-2	Automatically classify tickets from issue descriptions	5	High
US-3	Assign Category and Subcategory values	3	High
US-4	Implement dependent Category/Subcategory choices	3	Medium
US-5	Send automated caller notification	3	High
US-6	Maintain standardized and scalable classification rules	2	Medium

Sprint Schedule

Sprint	Focus	Planned Story Points
Sprint-1	Ticket Records, fields, classification foundation	8
Sprint-2	Category/Subcategory dependency and notification	6
Sprint-3	Testing, validation, update-set preparation and documentation	5

Planning Note

The planning document is a project-management artifact; its sprint dates and completion tracking are kept separate from the UAT execution dates. The dedicated planning PDF contains the complete tracker, velocity and burndown representation.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Functional / User Acceptance Testing

User Acceptance Testing was performed using the ServiceNow Developer instance, Ticket Records [u_ticket_records], and Flow Designer.

ID	Scenario	Tester	Date	Evidence / Ticket	Result
TC-001	Network / Wi-Fi classification	Wilson Thomas A.	30 Sep 2026	TIC0001001; Network / Wi-Fi	PASS
TC-002	Email notification generation	Dinesh S.	30 Sep 2026	Email generation check	PASS
TC-003	Hardware / Projector classification	Krishna Kumar T.	30 Sep 2026	TIC0001006; Hardware / Projector	PASS

Bug Tracking

No open UAT bug was recorded for the three documented test scenarios. No ticket number or email-log identifier is invented for TC-002 because none was supplied in the testing record.

6.2 Performance Testing

A separate performance-test artifact was not included because the applicable project-testing material did not define a performance-testing requirement for this ServiceNow Flow Designer project. The functional/UAT results are therefore reported without inventing performance measurements.

7. RESULTS

7.1 Output Results

The tested workflow successfully demonstrated automatic classification for the documented Wi-Fi and Projector scenarios and generation of the caller-notification workflow.

Tested Output	Observed Result
TIC0001001	Category = Network; Subcategory = Wi-Fi
Email notification generation	PASS according to the documented UAT scenario
TIC0001006	Category = Hardware; Subcategory = Projector

Deployment Artifact

The project update set was completed with 43 customer updates and exported to XML as the deployment artifact.

Output Screenshots

Screenshots are not embedded in this generated report because no screenshot files were supplied with the documentation templates. The report therefore records the verified output values from the UAT results instead of inserting unrelated or fabricated images.

8. ADVANTAGES & DISADVANTAGES

Advantages	Disadvantages / Constraints
Reduces repetitive manual ticket classification.	Classification depends on predefined keywords/rules.
Provides consistent Category/Subcategory assignment.	New issue wording may require additional rules.
Uses a no-code Flow Designer workflow.	The project does not use an ML model for semantic classification.
Supports dependent choice logic.	Rule maintenance is required when categories or scenarios change.
Automatically sends caller notification.	Performance metrics were not separately measured in the provided testing scope.
Structured Ticket Records support maintainability.	ServiceNow environment/configuration is required.

9. CONCLUSION

The project implemented a ServiceNow Flow Designer solution for automatic IT ticket classification. The solution connects ticket creation, predefined classification rules, Category/Subcategory assignment, standardized Ticket Records storage, and caller notification into a maintainable workflow.

The documented UAT scenarios for Network/Wi-Fi, email notification generation, and Hardware/Projector classification were recorded as PASS. The project also produced a completed update set containing 43 customer updates for deployment.

10. FUTURE SCOPE

- Extend the classification rules with additional IT issue categories and subcategories.
- Add more keyword patterns and synonyms to improve coverage of user descriptions.
- Add additional automated routing rules where required by the helpdesk.
- Expand notification content and notification scenarios as business needs evolve.
- Add broader automated regression/UAT scenarios when the workflow is extended.
- Evaluate more advanced classification approaches only if future project requirements justify them.

11. APPENDIX

A.1 Project Artifacts

Artifact	Status
Brainstorm & Idea Prioritization	Completed
Problem Statements	Completed
Empathy Map	Completed
DFD & User Stories	Completed
Solution Requirements	Completed
Technology Stack / Architecture	Completed
Problem–Solution Fit	Completed
Proposed Solution	Completed
Solution Architecture	Completed
Dedicated Project Planning Phase	Completed
User Acceptance Testing	Completed
Deployment Update Set	Completed

A.2 Key ServiceNow Configuration

Item	Configuration
Table	Ticket Records [u_ticket_records]
Trigger	Record Created; Category is blank
Classification	Predefined keyword-based Flow Designer rules
Dependency	Category controls Subcategory options
Notification	Email to Caller on ticket creation

A.3 Team

Name	Role
Mohan Srinivasan K.N	Team Leader
Krishnakumar T.	Team Member
Dinesh S.	Team Member
Wilson Thomas A.	Team Member
