

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	29 September 2026	Team ID	6ab75b2068850e4f5dce0e19
Project Name	Auto Ticket Classification using Flow Designer	Maximum Marks	4 Marks

Functional Requirements:

The functional requirements below are derived only from the actual project business requirements and implemented ServiceNow workflow.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Ticket Creation & Storage	Create a Ticket Record with Caller, Short Description, Description, State, and other defined ticket information in the standardized Ticket Records structure.
FR-2	Automatic Ticket Classification	Analyze the issue description at ticket creation using the predefined project keywords: WiFi, Projector, Password/Login, and Slow/Hanging.
FR-3	Category & Subcategory Assignment	Automatically assign Category and Subcategory without manual intervention using the configured classification mappings.
FR-4	Dependent Category / Subcategory	Maintain dependent choice logic so Subcategory options correspond to the selected Category: Network→Wi-Fi, Hardware→Projector, Access→Forgot Password, Performance→Slow Computer.
FR-5	Caller Notification	Send an automated email notification to the Caller after ticket creation with the ticket confirmation message.
FR-6	Maintainable & Scalable Flow	Use a no-code ServiceNow Flow Designer implementation with maintainable classification rules so the solution can support future growth and updates.

Non-functional Requirements:

Non-functional requirements are included because the project explicitly requires a no-code, easily maintainable solution and future scalability, while also targeting reduced manual effort and improved routing efficiency. Template items not supported by the project source are not added.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The ticket classification process should reduce manual classification effort for IT helpdesk staff and provide a consistent workflow.
NFR-2	Reliability	Configured classification and notification rules should operate consistently when a new Ticket Record is created.
NFR-3	Performance / Efficiency	Automation should classify tickets at creation time, reducing the time required for manual review and improving routing efficiency.
NFR-4	Scalability	The solution should support an increasing number of support requests and allow additional classification rules to be maintained as requirements grow.
NFR-5	Maintainability	The no-code Flow Designer implementation and predefined rules should be easy for the ServiceNow administrator to maintain and update.

Project scope note: Security and Availability are not listed as separate NFRs because the provided project requirements do not specify concrete security or availability requirements. No unrelated requirements have been added.
